### SOLRSearch Plus Dynamic UI

Make Search easy. Raritan's SOLRSearch Plus Dynamic Search Interface addresses many of the challenges that many companies face in finding and accessing their content. The pre-built solution can be configured to access any SOLR collection (if you need your content indexed and enriched for navigation, give us a call. We can do that too.) Our interface can be easily tuned to have your look and feel and is full featured and accessible via the web (including through browsers on mobile platforms).

You can instantly configure a User Interface that your customers will use to access your content. It can run in the Amazon EC2 environment or can be installed in your datacenter and has the typical Enterprise Search Features that you have become used to:

**Features Include** - Integrated Search and Navigation, Search Within, Breadcrumbs, Paging, Custom Sorting and Page Size, Hit Highlighting, Secure Login (Optional), Hyperlinking to record source, filetype detection with icon display, custom proprietary and help statements. Best of all, you can access this thru your Smartphone or tablet.

We built SOLRSearch UI on top of the Apache Solr Framework which can be supported by our partners at LucidWorks. As an Amazon technology partner our secure solution has been reviewed by Amazon and built using best practices to meet the security needs of the most demanding customers.

If you need help indexing your content, we can do that to. With our Connector Framework and DBpedia Content Enrichment tools we can leverage the crowdsourced collective knowledge of Wikipedia and have extensive topical coverage to enrich content in almost any vertical market segment. We can also use your taxonomies and vocabularies for additional enrichment (Facets/metadata).

The SOLRSearch Dynamic UI is available now. Give us a call and we'll demonstrate our capabilities to you and show how we can bring your search application live to have users all over the world finding your content right away.
